ABSTRACT

Emotions play an important role in our life. Intelligence and mental skills contribute to learning and adaptation. Emotional intelligence is a very important concept in the academic and non-academic community. The purpose of the present cross-sectional study was to investigate the influence of emotional intelligence on academic achievement in gifted students. This research is descriptive and of predictive type. The sample consisted of 61 (Female = 29, Male = 32) participants recruited from high school talented students of Khoy City in Iran. To measured the emotional intelligence we using Emotional Quotient Inventory (EQ-I) (Bar-On, 1997), and to measured students’ academic performance was using Grade Point Average (GPA). The study results showed that there was significant and positive correlation between emotional intelligence and gifted students’ academic achievement (r = .365, P≤ 0.004) and regression analysis showed that among of components of emotional intelligence, emotional self-awareness component had a significantly predicted power academic achievement of gifted students and other components had not a predicted power. Regarding the above results, relationship between emotional intelligence on academic achievement in gifted students has been discussed.

Field of Research: Academic achievement, Emotional intelligence, Gifted students.

1. Introduction

Emotional intelligence is defined by Salovey and Mayer (1990) as the process of one's assessment of his own and others' emotions accurately, to express feelings appropriately and process of emotional information including the regulation of emotion to make the life better. Studies investigating the relationship between trait EI and academic performance indicate that despite the weak correlation between intelligence and trait EI, it could act as a moderator factor between intelligence and academic performance (Chamorro-Premuzic & Furnham, 2006). Some studies have shown that a positive relationship between EI and academic success in school pupils (Hogan et al., 2010; Mayer, J., Salovey, P., & Caruso, D. 2008). Several studies reported no significant association between trait EI and academic performance (Mavroveli, Petrides, Sangareau, & Furnham, 2009). Petrides, Frederickson, and Furnham (2004) found that trait EI induce higher academic performance only within a group a low-IQ pupils. In this study we investigate the relationship between emotional
intelligence and academic achievement between gifted students, and predicted their academic achievement through components of emotional intelligence.

2. Workplace Experiences
Emotions play an important role in our life. Intelligence and mental skills contribute to learning and adaptation. Emotional intelligence has recently attracted a lot of interest in the academic literature (Mayer, Salovey, & Caruso, 2000; Roberts, Zeidner, & Matthews, 2001). Ability EI theory provides a framework within which to study the role of emotions in predicting academic performance (Mayer, Salovey, & Caruso, 2008). EI has also been found to be positively correlated with adaptive and negatively correlated with maladaptive coping (e.g. Austin et al., 2010).

3. Workplace Dissonance
Emotional intelligence refers to competencies in identifying, understanding, expressing, and managing emotion, in both self and others (Mayer, Salovey, Caruso& Sitarenios, 2001). Lack of reinforcement emotional skills can be followed of a variety of problems in interpersonal relationships and other social context.

4. Effects on Subsequent Intentions
According to Zeidner & Matthews (2000) intelligence is modestly related to positive attributes such as self-efficacy and ego resiliency, as well as reduced vulnerability to delinquency and some forms of mental illness. social–emotional strengths of the gifted child might be attributed to elevated levels of emotional intelligence (Zeidner et al., 2005), so emotional intelligence will affect in problem solving such as academic achievement in gifted students and In the context of education would developed the cognitive and emotional factors related to academic achievement.

5. Theoretical Framework

```
Emotional intelligence and its components  Academic achievement
```

Based on the objective of this study that is to examine the influence of Emotional intelligence on the gifted student’s Emotional intelligence, the above theoretical framework was developed (Figure 1). The instrument used was adopted from EQ-i -Bar-On, 1997.

6. Methodology
This research is descriptive and predictive type.

6.1 Sample and data collection method

The samples included gifted boys' and girls' students enrolled second grade mathematics and science courses from two high schools in Iran. The emotional intelligence questionnaire using 5-point Likert scale was used in assessing the students' emotional intelligence in middle of the academic year, then to collect students GPA were used list of students GPA final the academic year. After prior coordination with the school administrator the questionnaire in a group administered setting in the classroom.

6.2 Instrumentation

The following Table 1 indicates the measures of the study variables used in the study. The instrument items were adopted from previous studies by Emotional Quotient Inventory (EQ-I, Bar–On, 1997).

7. Finding & Discussion

As in Table 2 are noticeable relationship between emotional intelligence and academic achievement is positive and significant (r =0/365, p<0.004). Findings are consistent with the findings of Hogan et al., (2010); Mayer, Salovey & Caruso (2008) and also, there is a positive and significant relationship between academic achievement and components of Emotional Self-Awareness (r =0/375, p<0.003) and Assertiveness (r =0/276, p<0.031) and Self-Actualization (r =0/335, p<0.008) and Independence (r =0/319, p<0.012) and Optimism (r =0/279, p<0.020).

Table 3 shows that F (9/668) is a significant at the 0/003 level. This indicates that regression is the significant in first and second, at least one of the independent variables in predicting the dependent variable was effective. To understanding this we use partial regression coefficients and t-dependent test, and results show in table 4.

Dependent Variable: academic achievement

7.1 Reliability analysis
The internal consistency was evaluated by examining Cronbach alpha's for each scale. The coefficients least range from average $\alpha = .72$ (Stress Tolerance) to high $\alpha = .87$ (Independence) and consistency of other components are; $\alpha = .82$ (Emotional Self-Awareness) $\alpha = .79$ (Assertiveness) $\alpha = .85$ (Self-Regard) $\alpha = .82$ (Self-Actualization) $\alpha = .81$ (Empathy) $\alpha = .79$ (Interpersonal Relationship) $\alpha = .77$ (Social Responsibility) $\alpha = .81$ (Problem Solving) $\alpha = .81$ (Reality Testing) $\alpha = .78$ (Flexibility) $\alpha = .82$ (Impulse Control) $\alpha = .80$ (Happiness) $\alpha = .81$ (Optimism), and it's similar with Bar-On (1997) found coefficients range in US-study. Overall our results showed a very good reliability.

7.2 Descriptive statistics & analysis

The findings showed that the distribution of gender was higher for males with a total of 32 male respondents (52.46%). On the other hand, there were 29 female respondents or (47.54%) percent out of the total respondents. The age of the respondents showed that, 29.5% were 15 years old and the rest (70.5%) were 16 years old.

8. Conclusion and Future Recommendation

The study showed that there is a significant and positive relationship between emotional intelligence and academic achievement among students. Also the results showed that among components of emotional intelligence only emotional Self-Awareness had significant predictive power in gifted students’ academic achievement, and recommended:

- to investigate the relationship between emotional intelligence and other variables related to academic achievement
- to investigate relation between each component of emotional intelligence and other variables related to academic achievement
- to trying developed emotional intelligence as the goal of education.
